What do Smile Align Active Clear Aligners do?

Your teeth are kept in position by means of ligaments which form strong bonds between the jawbone and the teeth. Any orthodontic procedure aims to stretch these ligaments to a new position and hold them there until they heal and accept that new position. With clear aligners this process happens gradually and requires a specific time period to achieve optimum results.

Too much stretching over a short period could result in damage to the ligament and the tooth becoming loose. (Stay with the program, don't try to speed the process up by jumping aligners.)

How does the process work?

Discuss your expectations with your Dentist.

1

4

If required Smile Align staff will communicate any special circumstances to your dentist before proceeding with manufacture.

2

Your dentist will be able to decide if your case is suitable for Smile Align active clear aligners.

5

At your next visit to the dentist you will have the process explained to you in detail.

You will be given an instruction manual. Please follow these instructions rigidly. The system is only as good as your participation.

3

After taking and impression your case will be sent for analysis and design. (During this phase it will become apparent how many aligners you will need to reach your goal and how long you will have to wear them.)

6

As mentioned the specifics of the case will determine how many aligners you will need and how long the process will take. On average you will wear an aligner for two weeks before moving on to the next level. The process should last for about 12 weeks (Once again case dependent.)

Am I too old for aligners?

Not at all. (Let your Dentist make the final decision.) The advantage of clear aligners is that no one will know that you are wearing them.

Materials used

All of the materials used in the production of your Smile Aligners are CE certified. The aligners are made from a biocompatible polypropylene designed for long term use. The material complies with ISO 10993 & EN ISO 7405.
